2016 RETENTION POND CLEANING REPORT

On Wednesday, October 5, 2016 we began drawing the water level of the retention pond down as low as possible for it to dry out for the annual cleaning.

On Tuesday, October 11th we began the cleaning process with a track type skid steer loader, over the next 2 day approximately 3 truckloads of sludge were removed from the pond, cleaning it down to the clay base of the pond. After the sludge has dried it will be transported to the Cedar Ridge Landfill for disposal.

On Wednesday, October 12th Gary Dicky began the repair of the baffle wall in the pond that had rusted away at the water line. A composite sheet material was used for the repair to prevent it from rusting in the future. The baffle wall repair was completed that afternoon.

On Thursday, October 13th we began cleaning the pump chamber area where the discharge pumps are located, we pumped the remaining water out and began to clean and sludge and debris out of the bottom of the pump chamber. The pumps were cleaned of debris from the intake area, inspected and seem to be in good working order.

This concludes my report, if there are any questions fell free to give me a call.
